

DMX functions

The Magnum smoke machine operates from a single DMX channel which gives proportional control of fog density from 0-100%.

DMX Level	function
0 – 29	No fog
30 – 255	Fog at variable density, (30=minimum, 255=maximum)

When the machine is receiving valid DMX data, the indicator light next to the address switches will light.

It is possible to control the machine by DMX and using the remote control at the same time, the highest setting will take precedence.
